Task 1: Student Registration & Data Storage

Design a Student Registration Form using HTML5 and CSS3 that collects:

Name, Email, DOB, Department, Phone

Store the data in a database table and retrieve it using SELECT.

Aim

To design a **Student Registration Form** using HTML5 & CSS3, store the data in a database, and retrieve it using SQL SELECT.

Algorithm

1. Create a database and table to store student details
2. Design HTML form to collect:
    - Name
    - Email
    - DOB
    - Department
    - Phone
3. Apply CSS styling for better UI
4. Use backend (PHP) to:
    - Connect to database
    - Insert form data into table
5. Retrieve stored data using SQL SELECT
6. Display retrieved records in table format

Program:

Database (MySQL)

```
CREATE DATABASE student_db;

USE student_db;

CREATE TABLE students (
    id INT AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(50),
    email VARCHAR(50),
    dob DATE,
    department VARCHAR(50),
    phone VARCHAR(15)
);
```

HTML + CSS (Frontend):

```
<!DOCTYPE html>
<html>
<head>
    <title>Student Registration</title>

    <!-- ✅ Paste your pastel CSS HERE -->
    <style>
        body {
            font-family: 'Segoe UI', sans-serif;
            background: #fef6fb;
```

```
    display: flex;
    justify-content: center;
    align-items: center;
    height: 100vh;
}

.form-container {
    background: #ffffff;
    padding: 25px;
    width: 350px;
    border-radius: 15px;
    box-shadow: 0 8px 20px rgba(0,0,0,0.1);
}

h2 {
    text-align: center;
    color: #6d597a;
}

input, select {
    width: 100%;
    padding: 10px;
    margin: 8px 0;
    border: 1px solid #e0c3fc;
    border-radius: 8px;
    background-color: #f8f9ff;
}
```

```
        button {
            width: 100%;
            padding: 12px;
            background: #b5ead7;
            border: none;
            border-radius: 10px;
            cursor: pointer;
        }

        button:hover {
            background: #c7ceea;
        }
    </style>

</head>

<body>

<div class="form-container">
    <h2>Student Registration</h2>

    <form action="insert.php" method="post">
        <input type="text" name="name" placeholder="Name" required>
        <input type="email" name="email" placeholder="Email" required>
        <input type="date" name="dob" required>
```

```
        <select name="department">
            <option>CSE</option>
            <option>ECE</option>
            <option>EEE</option>
            <option>IT</option>
        </select>

        <input type="text" name="phone" placeholder="Phone" required>

        <button type="submit">Register</button>
    </form>

    <a href="view.php">View Students</a>
</div>

</body>
</html>
```

Insert.php

```
<?php
$conn = new mysqli("localhost", "root", "", "student_db");

if ($conn->connect_error) {
    die("Connection failed");
}

$name = $_POST['name'];
$email = $_POST['email'];
```

```
$dob = $_POST['dob'];
$department = $_POST['department'];
$phone = $_POST['phone'];

$sql = "INSERT INTO students (name, email, dob, department, phone)
VALUES ('$name', '$email', '$dob', '$department', '$phone')";

if ($conn->query($sql)) {
    echo "Registered Successfully!";
} else {
    echo "Error";
}

$conn->close();
?>
```

View.php

```
<?php
$conn = new mysqli("localhost", "root", "", "student_db");

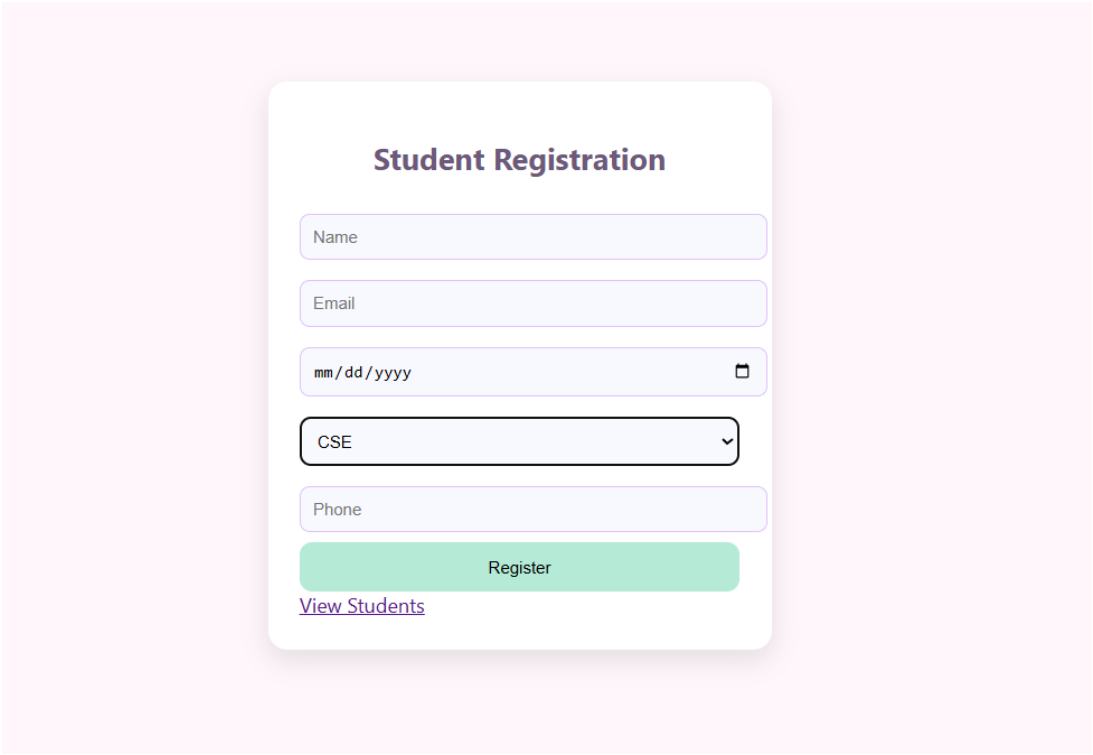
$result = $conn->query("SELECT * FROM students");

echo "<h2>Student Records</h2>";
echo "<table border='1'>
<tr>
<th>ID</th><th>Name</th><th>Email</th>
<th>DOB</th><th>Dept</th><th>Phone</th>
</tr>";
```

```
while ($row = $result->fetch_assoc()) {
    echo "<tr>
    <td>{$row['id']}</td>
    <td>{$row['name']}</td>
    <td>{$row['email']}</td>
    <td>{$row['dob']}</td>
    <td>{$row['department']}</td>
    <td>{$row['phone']}</td>
    </tr>";
}

echo "</table>";
```

Output:



Student Records

ID	Name	Email	DOB	Dept	Phone
1	S.Sreeja	sreeja@gmail.com	2007-10-28	CSE	9963431866
2	CH.Laya Sree	laya12@gmail.com	2007-04-20	ECE	9966616171

Result:

The student details were successfully collected through the form, stored in the database, and retrieved using SQL SELECT query.
