Task 3: Login System with Validation

Description: Develop a Login Page:

Validate inputs using JavaScript

Check credentials from database

Show error messages dynamically

Real-Time Usage: Authentication systems for any web application.

give proper codes

Aim

To develop a login system that validates user inputs using JavaScript, verifies credentials from a database using PHP, and displays error messages dynamically.

Algorithm

1. Create a database table to store user credentials
2. Design login form using HTML
3. Validate inputs using JavaScript
4. Send form data to PHP
5. Connect PHP to MySQL database
6. Check username and password using SQL query
7. Display success or error message

Program:

Login.html

```
<!DOCTYPE html>
<html>
<head>
  <title>Login Page</title>

  <script>
    function validateForm() {
```

```
        let username = document.forms["loginForm"]["username"].value;
        let password = document.forms["loginForm"]["password"].value;

        if (username == "" || password == "") {
            document.getElementById("error").innerHTML = "All fields are required!";
            return false;
        }

        if (password.length < 4) {
            document.getElementById("error").innerHTML = "Password must be at least 4
characters!";
            return false;
        }

        return true;
    }
</script>

<style>
    body {
        font-family: Arial;
        background: #fef6fb;
        text-align: center;
        padding-top: 100px;
    }

    form {
```

```
            background: white;
            padding: 20px;
            display: inline-block;
            border-radius: 10px;
        }

        input {
            margin: 10px;
            padding: 8px;
            width: 200px;
        }

        button {
            padding: 10px;
            background: #b5ead7;
            border: none;
            cursor: pointer;
        }

        #error {
            color: red;
        }
    </style>
</head>

<body>
```

```
<h2>Login</h2>

<form name="loginForm" action="login.php" method="post" onsubmit="return
validateForm()">
    <input type="text" name="username" placeholder="Username"><br>
    <input type="password" name="password" placeholder="Password"><br>

    <p id="error"></p>

    <button type="submit">Login</button>
</form>

</body>
</html>
```

Login.php:

```
<?php
session_start();

$conn = new mysqli("localhost", "root", "", "student_db");

$username = $_POST['username'];
$password = $_POST['password'];

$sql = "SELECT * FROM users1 WHERE username='$username' AND password='$password'";
$result = $conn->query($sql);

if ($result->num_rows > 0) {
```

```
    $_SESSION['user'] = $username;   // store session

    header("Location: dashboard.php");  // go to Task 2
    exit();
} else {
    echo "<script>alert('Invalid Login'); window.location='login.html';</script>";
}
?>
```

dashboard.php:

```
<?php
session_start();

// 🔒 Protect page (login required)
if (!isset($_SESSION['user'])) {
    header("Location: login.html");
    exit();
}

// Database connection
$conn = new mysqli("localhost", "root", "", "student_db");

if ($conn->connect_error) {
    die("Connection failed: " . $conn->connect_error);
}

// Get filter & sort values
$department = isset($_GET['department']) ? $_GET['department'] : '';
```

```
$sort = isset($_GET['sort']) ? $_GET['sort'] : 'name';

// Base query
$sql = "SELECT * FROM students";

// Apply filter
if ($department != '') {
    $sql .= " WHERE department='$department'";
}

// Apply sorting
if ($sort == 'dob') {
    $sql .= " ORDER BY dob";
} else {
    $sql .= " ORDER BY name";
}

$result = $conn->query($sql);
?>

<!DOCTYPE html>

}
?>

</table>

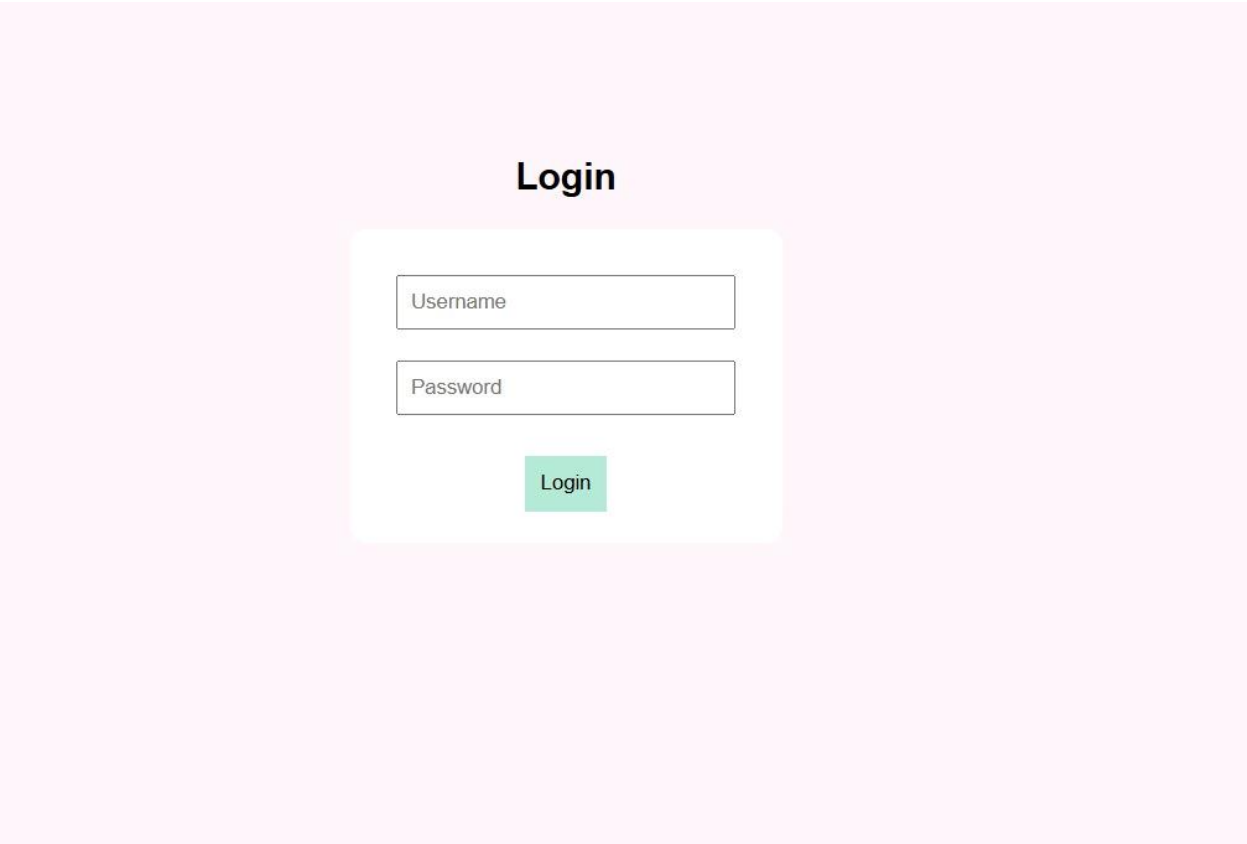
</body>
</html>

<?php
$conn->close();
?>
```

Output:



Result:

The dashboard successfully displays student records with sorting and filtering options.
It also shows the count of students in each department using SQL aggregation.
